PRODUCT DOSSIER

The complete system

Product, flows, edge cases & open questions

A single-serving supplement brand built as an ecosystem: a daily sachet at the centre, wrapped in a mobile app, a consumption-driven subscription, a two-sided referral program, and a partner loyalty layer. This document walks the entire product from the ground up — every flow, every edge case, and every decision still open.

What's inside

This dossier is product-first. It defines the language, then walks each layer of the system end-to-end, and closes with a consolidated edge-case catalogue, the open-questions register, and the phased roadmap.

Vision & the two-layer model

1

One daily sachet with everything a recreational athlete needs, mixed with water — and an ecosystem around it that turns a consumable into a habit, a community, and a growth engine.

NOOR is a single-serving supplement brand: one daily sachet (creatine, B12, magnesium, vitamin C, and so on) that a recreational athlete mixes with water. The product is the hero. Everything else exists to make the habit stick and to let the people who love it help it grow.

1

The product

A daily sachet in a Box of 28 (≈4 weeks). Simple, effective, single-serving.

4

Ecosystem layers

App & gamification, a consumption-driven subscription, a referral program, a partner loyalty program.

North star

A community that co-creates future products. The app and levels are the vehicle; the product stays the hero.

The principle everything hangs on

The system deliberately separates **two layers** that are easy to confuse. Keeping them apart is what makes the whole model coherent.

Layer 1 — Supply (the Subscription)

The commercial promise: NOOR guarantees product arrives when you're running low. You pay per Box, at shipment. This layer works *whether or not* you ever open the app.

Layer 2 — Engagement (scanning)

Opening the app and scanning unlocks the ecosystem: streaks, XP, levels, perks, and consumption-aware refill timing. Engagement is optional but is where the magnetism lives.

WHY IT MATTERS

A customer who never engages still gets a reliable product on a subscription — so the business never depends on gamification working. A customer who *does* engage becomes far harder to lose, spends more over their lifetime, and can eventually become a seller. The two layers de-risk each other.

The language

Every term below is used precisely and consistently across the whole system. Where several words mean the same thing, NOOR picks one and avoids the rest — this precision is what keeps the product buildable.

Product & consumption

Term	Definition	Not called
Box	The physical carton shipped to a Member. Contains 28 Sachets (≈4 weeks). Carries one unique QR code used to activate it against an account.	<i>package, carton, kit</i>
Sachet	A single-serving pouch inside a Box, mixed with water and drunk. Carries a QR that is not unique (shared across all sachets). Scanning it is an engagement act, not a commercial one.	<i>packet, serving</i>
Subscription	A Member's standing agreement to receive Boxes. Billed per Box at shipment , not on a calendar. Guarantees supply regardless of scanning.	<i>plan, membership</i>
Box Activation	Scanning a Box's unique QR against an account. Starts the consumption clock and unlocks the ecosystem for that Box. Also the moment referral commission is earned — the "real sale" event.	<i>registration, claiming</i>
Refill	Shipment of the next Box, triggered by the first of: supply running low, a "running low" button, or a time cap.	<i>reorder, restock</i>
Standalone Box	A gift or retail Box activated without a Subscription. Its holder earns XP/Streak but can't redeem Perks until they subscribe.	<i>trial box, free box, sample</i>

People & status

Term	Definition	Not called
Member	A person with a NOOR account and an active Subscription . Membership gates loyalty perks.	<i>user, customer, subscriber</i>
Prospect	An account with no subscription that has never held one. May have activated a Standalone Box. Becomes a Member on first Subscription.	<i>lead, guest, trial user</i>
Lapsed Member	A former Member whose Subscription is no longer active. All history is retained ; Level/XP frozen (not reset); Perk redemption paused until reactivation.	<i>churned, expired, ex-member</i>
Agent	A Member who levelled up, applied, and was approved into the mass, self-serve, tiered-commission referral channel. Sees only their own commission data.	<i>reseller, ambassador</i>
Affiliate	A hand-picked referrer (trainer, influencer) added manually on a fixed negotiated % — outside the tier ladder. A trainer-type Affiliate may also see a referred client's consumption (opt-in gated).	<i>referrer, reseller</i>
Partner	A business (gym, shop, event) that funds Perks as its own customer-acquisition spend. Earns no commission.	<i>sponsor, vendor</i>

Gamification

Term	Definition	Not called
Streak	Consecutive days (in the Member's account timezone) on which a Sachet is scanned. Drives habit; applies a small XP multiplier; forgiven in two layers before it breaks.	<i>chain, run</i>
XP	Cumulative points per daily scan × streak multiplier. Never decreases. Because you can only scan sachets you bought, XP is a proxy for lifetime spend.	<i>points, score</i>
Level	A milestone tier reached on cumulative XP. Never drops. Gates which Perks you can access. Frozen while lapsed.	<i>tier, rank</i>
Perk	A benefit unlocked by Level. Every Perk is either partner-funded or spend-funded . Redeeming any Perk requires an active Subscription.	<i>reward, bonus</i>

One flagged ambiguity resolved: "Subscription" is the commercial recurring-shipment agreement; "Membership" is the loyalty standing that unlocks perks. A lapsed Subscription pauses Membership perks. They are kept strictly distinct.

Subscription & refill DECIDED

3

NOOR does not bill on a calendar. It bills for product when product ships — and it ships when you're actually running low, not on a fixed date.

How billing works

- **Billed per Box, at the moment of shipment** — not monthly. Revenue is variable by design, and that variability is accepted because it aligns cost with real consumption.
- The Subscription **guarantees supply** regardless of whether the Member ever scans. Scanning is a separate layer that only *improves the timing*.

What triggers a refill

A refill (the next Box shipping) fires on the **first** of three triggers:

SAFEGUARD

A time-cap auto-shipment is always preceded by a **3-day advance notice with a skip / pause option**, so no one is ever charged for a Box they didn't want without a chance to stop it.

The aggregate supply model

When a Member owns several active Boxes, supply is counted as **one pool** ($28 \times$ number of Boxes), not per-Box. The refill fires on the pool dropping to ≤ 7 , and — crucially — this same pool is the ceiling for how much XP/streak can ever be earned. This is the **fraud floor** (see §5): you can never earn more engagement than sachets you actually bought.

Lifecycle & lapse

DECIDED

4

Every account moves through three states. The transitions — and what is kept versus paused at each — are fully defined.

What causes a lapse — only two things

Voluntary cancellation
The Member chooses to stop. All history is retained as a win-back lever.

Failed refill charge
A charge happens at every refill. If one fails and isn't recovered during a past-due (dunning) window, the account lapses. One failed charge ≠ instant lapse.

What is kept, frozen, or paused

On lapse	Behaviour
XP, Level, Streak, history	Retained in full — never erased on cancellation. Erasure only via account deletion or a defined dormancy period (both parked).
Earning XP / Streak	Continues on already-paid sachets the Member physically holds. Earning follows paid product, not subscription status.
Perk redemption	Paused until the Subscription reactivates. Redemption follows active subscription.

DESIGN INTENT
A lapsed Member keeps everything that makes coming back attractive. The freeze — not a reset — is a deliberate win-back mechanism: your levels and streak are waiting for you.

Open: the exact dunning-window length and retry cadence depend on the payment provider (currently parked), but the parameter's home is defined.

Scan model & fraud floor

DECIDED

5

Two QR codes drive the entire system. The design lets the honour-system scanning stay light while making cheating structurally impossible to profit from.

Event	QR	Unique?	Drives
Box Activation	on the Box	Yes	ownership, fraud floor, refill clock, referral commission, ecosystem unlock
Sachet scan	on the sachet	No (shared)	streak, XP, reminders — capped by Boxes owned

Why cheating doesn't pay

- **The fraud floor:** XP and streak can never exceed sachets actually bought (28 × Boxes owned), computed across the whole pool. A shared sachet QR is harmless — you can't out-scan what you paid for.
- **One scan per day earns** XP/streak; extra scans are allowed but earn nothing.
- **Works fully offline** (poor gym signal): scans queue locally and sync on reconnect, with no loss.

Two anti-fraud walls on the Box QR

Physical — tamper seal

The Box's unique QR is hidden under a seal, revealed only when the Box is torn open. Defeats in-store or in-transit photographing.

Software — one-time bind

Once a Box QR is bound to an account it can **never** bind to another. No duplication.

A USEFUL SIDE EFFECT

Because the QR is only revealed on opening, a Box need not be pre-assigned to a person. The same mechanism serves subscription today *and* future retail/gifting with no redesign.

Activation edge cases — all resolved

Situation	Resolution
Damaged / unreadable QR	A human-readable ~12-char code is printed under the same seal. Type it in → identical one-time activation. Cheap; resolves most failures without support.
QR already bound to another account	Message + path to support, never an automatic accusation : "already activated on another account — contact support if this is a mistake." The attempt is logged as a signal; a human arbitrates.
Box never arrived	Billing is per shipment, so a lost parcel means charged-but-nothing-to-activate. Handled as a fulfilment/support case (re-ship or refund). The refill clock starts at activation, not shipment — so a lost Box advances nothing, which is correct.

All three lean on a **"contact support" surface that does not yet exist** — tracked as a cross-cutting gap (see §13).

Gamification PARTIALLY DECIDED

6

Streak, XP, Level and Perks turn a daily habit into a game with real stakes — and every reward is funded, never free money.

Streak — the habit engine MECHANICS DECIDED

- A **"day"** is a calendar day in the Member's **account timezone** — not UTC (would break evening scanners), not the device clock (would let people cheat by changing the time).
- **Two-layer forgiveness** before a streak breaks:
 1. **Automatic weekly grace:** one missed day per rolling 7-day window *holds* the streak — no token needed.
 2. **Freeze tokens:** earned by Level, consumable, protect additional consecutive days for planned gaps (vacation, illness).
- **The Member always knows their state** — "you missed yesterday but your streak is safe (weekly skip used)", or a motivational restart message when it truly breaks. Never a silent reset.

The funding rule — every Perk is paid for

This is the discipline that keeps rewards sustainable. Every Perk maps to one of exactly two funding purses, and nothing erodes NOOR's own product price.

● Zero-cost (status)

Badges, titles, themes, leaderboards, product votes, beta access, freeze tokens, private community.

● Partner-funded

A Partner absorbs the cost as acquisition spend: tiered shop discounts, early drops, event access.

● Spend-funded

Bounded NOOR cost, financed by the lifetime spend the Level represents: premium flavours, a "better Box", free shipping, milestone reward Box.

HARD RULE — NEVER

No "% off your own subscription per Level," and nothing cumulative or compounding. Rewarding engagement by cutting core product revenue is explicitly forbidden — it's the one thing that would quietly bankrupt the model.

Open: the number of Levels, their names, XP thresholds, the exact XP formula, and which unlock maps to which Level. The *structure* of the three purses is fixed; the specific assignments are not.

Agent & Affiliate program

STRUCTURE DECIDED

7

The referral layer turns loyal customers into a salesforce — and keeps a curated lane for hand-picked names. This is where the gamification funnel becomes an acquisition engine. **All percentages below are placeholders** until product cost is known.

Three roles, one clean distinction

Role	Who	Commission	Sees client consumption?
Agent	A Member who levelled up & was approved	Tiered , rises with active referred subscriptions	No — own earnings only
Affiliate	Hand-picked trainer / influencer, added manually	Fixed negotiated %	Trainers only, opt-in gated
Partner	A business	None — funds Perks instead	No

The Agent path — anyone can earn their way in

Fixed Level, moving intake

The eligibility Level is **never moved on people mid-grind** — moving the goalposts would kill motivation. Supply is controlled instead by **capped waves**: a scarcity event, not a lever on the goal.

City-targeted waves

A wave can target a delivery city using the shipping address NOOR already holds — "I need 10 in Valjevo" shows the opportunity only to eligible Members there. No new data collected, nothing shared externally.

Must use the product

An Agent must be an **active Member**. If they lapse their own subscription, Agent status **pauses** until they return.

Not selected loses nothing

You keep your Level and stay eligible, on a waitlist for the next window. There is no "rejected" state — only "spots full".

Tiered commission

An Agent's rate rises with the number of active referred subscriptions (placeholder: 5% → 10% → 15%). One structural choice is deliberately left open, to decide alongside pricing:

Option A — Marginal band OPEN

Subscriptions ranked; first band at the low rate, next band higher. Stable, but the "level-up" feeling is weaker.

Option B — Whole-book tier OPEN

Current count sets *one* rate for the entire portfolio — crossing a threshold lifts *all* clients at once. Stronger motivation; smoothed with a monthly snapshot + hysteresis so one lost client can't demote you harshly.

The economics — structure locked, numbers pending

The old model baked a fixed ~20% acquisition budget into price (10% buyer discount + 10% commission). Tiered commission breaks that ceiling, so the economics were restructured around one invariant that holds no matter what the final numbers are:

THE INVARIANT

The **buyer's discount is fixed** regardless of the Agent's tier (a buyer is never penalised for having a high-earning agent). **Commission is the only lever that scales**. So the total acquisition budget **floats** — the lowest tier is the cheapest, the highest tier the most expensive — and the worst-case top tier must still fit under margin once cost is known.

The buyer's discount is permanent and survives the referrer leaving. If an Agent or Affiliate departs, NOOR recaptures the commission slice, but the buyer keeps their discount for the life of the account — a deliberate acquisition lever.

Single-level only — no MLM

A HARD BOUNDARY

A referrer earns **only** on Members they personally brought — **never** an override on other agents beneath them. When a referred Member becomes an Agent themselves, they are fully independent. This keeps the program a clean, lawful single-tier affiliate model and removes all pyramid-scheme exposure by construction.

Payout — through a marketing agency

Because the Agent channel is mass and most Members are private individuals, NOOR cannot wire recurring commission to hundreds of people directly. A **paušalna marketing agency sits in between** as the payout rail:

Commission lifecycle: **Accrued** on Box Activation → **Cleared** after a 30-day hold (refund/chargeback before clearing claws it back) → **Payable** → **Paid** monthly, above a minimum threshold.

Attribution & offboarding

Topic	Rule
Attribution	First-touch referral code at signup, locked for the life of that subscription. Retroactive linking only within a grace window (14 days / 2nd Box). After that, the Member is "organic" and unclaimable.
Real-life trainer change	Commission stays with the original referrer (the system can't see off-app changes); disputes handled by support, not an algorithm.
Referrer leaves	Code stops binding new Members; open commissions run out their lifecycle; dashboard goes read-only. The buyer keeps their discount.
Agent lapses own sub	Status + commission accrual paused until reactivation — a built-in incentive to stay subscribed.

Fraud posture at mass scale

Opening the channel to the masses raises the self-dealing incentive. v1 relies on structural and economic guards rather than heavy detection:

- **Level-cost of entry** — you must genuinely consume to level up, so every Agent account costs real spend. The single strongest barrier.
- **Hard block** on literal self-referral (own code on own account).
- **Hold + clawback** — a fake sale that refunds before clearing pays nothing.
- **Commission only while the sub is active** — a fake account that cancels stops paying.
- **First-payout activity gate** — commission on a referred Member only starts clearing once that Member crosses a real-activity mark (e.g. 2nd Box), so an account that never truly consumes never pays out.

Deferred (consciously, at mass scale): soft-flag detection — shared payment/address/device → commission held → admin review → repeat-pattern suspension. Designed, not yet built.

Later versions

Bonus progress bar V2

A repeating milestone spiff on cumulative Box-activation volume (placeholder: every 100 activations → €500) — counts order volume, so it rewards retention as much as acquisition. On top of commission, with its own budget line.

Leaderboard V2+

Agent of the Month / Year, ranked by period performance so it's a fresh race each period, not dominated by seniority. Prizes from a separate budget.

Loyalty & Partners

PARTIALLY DECIDED

8

A Partner is a business that funds Member discounts as its own customer-acquisition spend. The gating is settled; how each Partner verifies a Member at the moment of redemption depends on how that Partner wants to cooperate.

Membership gating is fixed: an active Subscription means Perks are live, and Level selects the discount tier. What remains is the **verification flow**, which should support a spectrum rather than one rigid method.

Physical shop / gym

A rotating, time-limited member QR in the app (~30s, like 2FA). The Partner scans it on a lightweight web page → gets back only "valid member, Level X, tier Y". Rotation defeats screenshot-sharing.

Online partner

A single-use discount code per Member per redemption, tied to their Level. Used once → dead.

Low-tech partner

Simple member lookup: enter a member number → yes/no + tier.

PRIVACY PRINCIPLE

A Partner never sees a name, contact, or history — only "valid + tier". The same boundary as the referral program.

Open: which Partner type(s) launch first (likely local gyms/shops), Partner onboarding & agreements (who funds the discount, tier mapping, contract), and the exact discount-tier ↔ Level mapping.

Reminders & notifications V1 HEURISTIC DEFINED

9

The biggest risk in any habit app is over-notifying into an uninstall. So governance — not the algorithm — is the spine of this feature.

Five reminder types

1. Daily nudge (at the learned time) · 2. Missed day · 3. Streak at risk · 4. Logistics (running low / Box expiring) · 5. Re-engagement (after absence, decaying frequency). Each independently toggleable.

Governance — the key

One smart habit reminder per day (types 1–3 collapse into a single message, never three). Quiet hours. Auto back-off: ignore 3 in a row → frequency self-reduces. Respects OS permission.

How the timing is learned

- **Purely from scan behaviour** — the app never asks when you drink (observed behaviour beats stated).
- **Per day-of-week** (Saturday ≠ Tuesday), blended toward a global average when a given weekday has little data.
- **Zero history → no predictive nudge**, only a gentle reactive "missed day" until data accrues. Scattered times fall back to the soft reminder.
- **Fires locally** so it works offline.

PRIVACY TIE-IN

Time-of-day of scans is internal only — it powers the Member's own reminders and is **never** shared with a trainer, even one with the coaching view. Trainers see *which days*, never *what time*.

Open (cross-cutting): transactional notifications — order/shipping confirmation, tracking. The local reminder engine is habit-only; nothing yet tells a Member their Box shipped. Tied to fulfilment (parked).

Community & co-creation

10

DIRECTION, NOT A HARD V1 COMMITMENT

The north star is a community that co-creates future products — delivering that feeling without building and moderating a full social network.

Structured, not a feed

An idea/flavour board (submit + upvote), product votes (NOOR posts a choice → members vote), and beta cohorts (higher Levels test new products and give structured feedback).

Loop-closing — the payoff

"Made because you voted" + notifying the voters. The emotional moment that turns a customer into a co-owner.

Free chat lives off-app

Discord/Telegram, linked from the app — no in-app feed in v1, so minimal moderation burden.

Advisory, all votes equal

The community signals, NOOR decides (supply/cost may not allow honouring a raw vote). Level does not weight votes. Framed as "your vote strongly shaped this."

Technology overview DECIDED

A deliberately lean, modern stack chosen so a small team can build and operate the whole system. Kept high-level here — the point is that nothing in the product above requires exotic infrastructure.

Mobile app

Expo (React Native) — one codebase for iOS & Android. Local, offline-capable notifications; secure on-device session storage.

Backend

Supabase — a managed Postgres database with built-in authentication and row-level security. Single source of identity.

Offline-first

Scans queue on the device and sync on reconnect, deduplicated so nothing double-counts. Streaks compute from the scan date, not the sync date — weeks offline lose nothing.

Privacy by construction

Row-level security enforces that a trainer sees only opted-in clients and never another trainer's clients. The server is the single source of truth for XP/Level/Streak.

Identity & sign-in

Actor	Sign-in	Self-signup?
Member (mobile)	Google + Apple	Yes
Agent (web portal)	Existing Member email, once approved in a wave	No — approval-gated
Affiliate (web)	Email one-time code; invite-only	No
Admin (web)	Email one-time code; provisioned	No

An Agent is not a separate identity — it is a Member whose account gains the referral surface. One person, one account.

Edge-case catalogue

12

Every non-obvious situation surfaced by walking each flow end-to-end, and how the system handles it. Consolidated here so the whole risk surface is visible in one place.

Situation	Handling	Status
Damaged / unreadable Box QR	Human-readable backup code under the same seal; typed in for identical activation.	DECIDED
Box QR already bound elsewhere	Message + support path, never an auto-accusation; attempt logged, human arbitrates.	DECIDED
Box never arrived	Fulfilment/support case (re-ship/refund). Refill clock starts at activation, so nothing advances.	NEEDS SUPPORT SURFACE
Scanning offline for weeks	Local queue with idempotency key; syncs on reconnect; streak computed from scan date. No loss.	DECIDED
Two devices / device change	Server is canonical; new device pulls state; two devices harmless (per-day dedup). Un-flushed queue on a dead phone is a rare accepted loss.	DECIDED
Clock-change cheating	Day boundary is account-timezone, not device clock; server clamps suspicious timestamps; fraud floor bounds the rest.	DECIDED
Multiple active Boxes	Supply and fraud floor computed on one aggregate pool, not per Box; refill on pool ≤ 7 .	DECIDED
Missed a day	Weekly automatic grace, then Level-earned freeze tokens; only breaks when both are exhausted; always communicated.	DECIDED
Failed refill charge	Enters a dunning window; recovered $\rightarrow$ no lapse; unrecovered $\rightarrow$ lapse. One failure $\neq$ instant lapse.	WINDOW LENGTH OPEN
Member cancels then returns	All history retained & frozen; reactivation restores redemption. A win-back lever.	DECIDED
Gift/retail Box, no subscription	Standalone Box: holder earns XP/Streak but can't redeem Perks until they subscribe; depletion prompts conversion.	CHANNEL POST-V1
Self-referral (own code)	Hard-blocked outright.	DECIDED
Referrer's alt-account ring	Level-cost of entry + hold/clawback + activity gate blunt it; soft-flag detection designed but deferred.	DETECTION DEFERRED
Referred Member changes trainer IRL	Commission stays with original referrer; disputes via support.	DECIDED
Referrer leaves / is removed	Code stops binding; open commissions run out; dashboard read-only; buyer keeps discount.	DECIDED
Agent lapses own subscription	Agent status & commission accrual paused until they reactivate.	DECIDED
Client turns off consumption sharing	Coaching view goes dark; commission & attribution untouched. Withdrawal must be as easy as giving.	LEGAL BASIS OPEN

Open questions & parked items

Nothing here is a surprise-in-waiting — each item was found deliberately, recorded, and given a home. This is the honest map of what is not yet decided.

Needs a decision

Item	Note
All referral numbers	Discount %, tier %s + thresholds, budget, bonus values — blocked on product cost → price. A dedicated financial-modelling pass fills the agreed structure.
Agent tier structure	Marginal-band vs whole-book — both on the table, decided alongside pricing.
Level design	Number of Levels, names, XP thresholds, the XP formula, and which Perk maps to which Level.
Contact-support surface	Several flows end at "contact support," but no support channel/screen is defined anywhere yet.
Transactional notifications	Order/shipping/tracking messages — the reminder engine is habit-only. Tied to fulfilment.
Coaching-visibility legal basis	How "sticky" a trainer's view of client consumption can be — consent (revocable) vs "coaching is part of the product". Needs legal confirmation; supplement-consumption data may count as health data.
Dunning window	Length + retry cadence — depends on the payment provider.
Prospect home screen	What a logged-in, not-yet-subscribed person sees before their first subscription.
Partner specifics	Which partner types launch first, onboarding/agreements, tier ↔ Level discount mapping.

Parked — deliberately deferred

Recorded so the reasoning isn't re-litigated on return. Several open items above can only be fully closed once a parked topic is unparked.

- Payment provider & off-session charging
 - Fulfilment & inventory
 - Refund / returns policy
 - Account deletion / data-rights & dormancy erasure
 - Cross-border affiliate payout & tax (Dubai → Serbia)
- Supplement regulation & health claims
 - Legal entity / jurisdiction
 - Go-to-market / first-member acquisition
 - Member-to-member referral (give-a-friend)
 - Soft-flag fraud detection (designed, deferred)
 - Gift / retail channel (model fixed, channel post-v1)

Roadmap & phasing

14

What ships first, what waits, and what is intentionally held back. The v1 line is drawn to prove the core loop — habit, subscription, and the referral engine — before layering on breadth.

The critical path

THE HEADLINE

The **entire product structure is decided** — flows, edge cases, roles, safeguards, and the shape of the economics. What remains is largely *filling numbers into a fixed frame* once product cost is known, and unparking the operational topics (payments, fulfilment, regulation) in sequence. The system was designed so those can be slotted in without redesign.
